

a little **BACKGROUND**

I'm a firm believer in exploring my imaginative potential and giving back to the community. A little bit of taking and a whole lot of giving!

My enthusiasm for art is displayed in almost every aspect of my life. I've put in many extra hours to expand both the methodological and technical skills required for an upcoming tech leader. I seek to learn, grow and connect with people that dream as big as me who believe they can resolve problems effectively while simultaneously building solutions to positively affect the global community one person at a time.

Ayushi Raj
Web Developer

CDEC Provider Hub

PROBLEM

To launch the ‘Licensing Application Portal’ within the Provider Hub Portal so as to digitize application processes for State of Colorado.

CONTRIBUTION

Full UI development using HTML, CSS, JS, Salesforce Lightning Web Components, Salesforce Lightning Design System, Invision Studio

IMPACT

- Conducting requirements gathering, design, build & System Integration Testing.
- Redesigning the Licensing product suite within the Provider Hub Portal.

REFLECTION

Previous interface specifications were retained: any changes to the frequency, format, content, or rules of an interface followed the change control process. Designs were made keeping the SLDS guidelines in mind.

TIMELINE

12 weeks (2021)

Movie Recommendation System using Python

PROBLEM

To recommend movies to users based on movie information seeing patterns observed in the training dataset.

CONTRIBUTION

Collaborative Filtering using K-means clustering, minimizing the mean-squared error computed using dataset provided by *movielens*, executed with the `sklearn.cluster` library

IMPACT

- Collect data for previous ratings by different users and analysis of the entire dataset.
- Identify user preferences and similarity.
- Prediction based on trends with Collaborative filtering.

REFLECTION

Recommender model was built according to datasets available and users were given suggestions of movies in accordance with what they've rated other movies that they've liked in that genre. The most promising strategy is the one where the clustering and optimisation algorithms offer the best presentation in terms of precision and speed.

TIMELINE

4 weeks (2018)

Grocery Management System (iON - Tata)

PROBLEM

To design a website for taking and delivering orders for groceries.

CONTRIBUTION

Front-end support using PHP

Back-end data storage and access using MySQL

IMPACT

The website's homepage guided the user to different departments and each department's page gives the details of the stuff available in store as well as their prices and quantity to make the specific order.

REFLECTION

All the tables stored data regarding price, quantity, delivery time and ratings of the items and those were stored in MySQL and accessed through PHP to make orders in real time with the accuracy in their availability.

TIMELINE

6 weeks (2016)
