

Networking in the Right Context

One of the main reasons that professionals find themselves unsatisfied with the networking process is that they find that they simply do not have enough time to spend doing networking activities. In fact, 41 per cent of professionals want to network more frequently but say they don't have enough time to do so. Initially, this argument could be taken for face value. It's true that in a busy world a lot of time is spent commuting, in meetings or working on projects.

Professional Networking Using the Dating Model

Brands are beginning to realize that common ground for networking can now be found or created, on their own applications. Some dating apps, which traditionally function with a "swiping" model to sort potential partners, have modified their platforms to include options for professional networking. After noticing that users were using the dating platform to network for professional opportunities, Bumble launched "Bumble Bizz" in late 2017 to take advantage of matching business-minded networkers with each other. And the former CTO of Tinder launched the networking app Ripple earlier this year also based on the model of swiping left or right to get a match.

These brands retain their original formatting for their networking applications, meaning that even though the purpose has changed the underlying idea of selection exists. By presenting photos and minimal background information, users can swipe through decks of potential matches. If two members match, they move to a chat where they decide if they are interested in meeting face-to-face. This model does little to ease the initial barriers that are present with online networking, and oftentimes it is up to the users to develop their own icebreakers.

AI-Driven Networking Experiences

With AI (artificial intelligence) becoming a large part of our day-to-day lives, it's no surprise that it will impact the world of professional networking. The algorithm can analyze the professional's data to identify career goals, interests, and general experience. A bot can match the user to like-minded individuals to streamline the networking process with the networker's consent. If you are a small business owner, this technology will allow you to optimize your professional contacts. Professionals with eCommerce will be better able to build relationships with vendors, suppliers, and new customers worldwide as the AI algorithm connects them with the right people. AI-driven

networking experiences can help you raise capital, identify leads, and close deals by making their business network more effective.
